Tufted pyramidal cell article vs. Neuron implementation

Adapt the model to thalamo-cortical loop in the rat somatosensory system (Sakmann et al. and others)

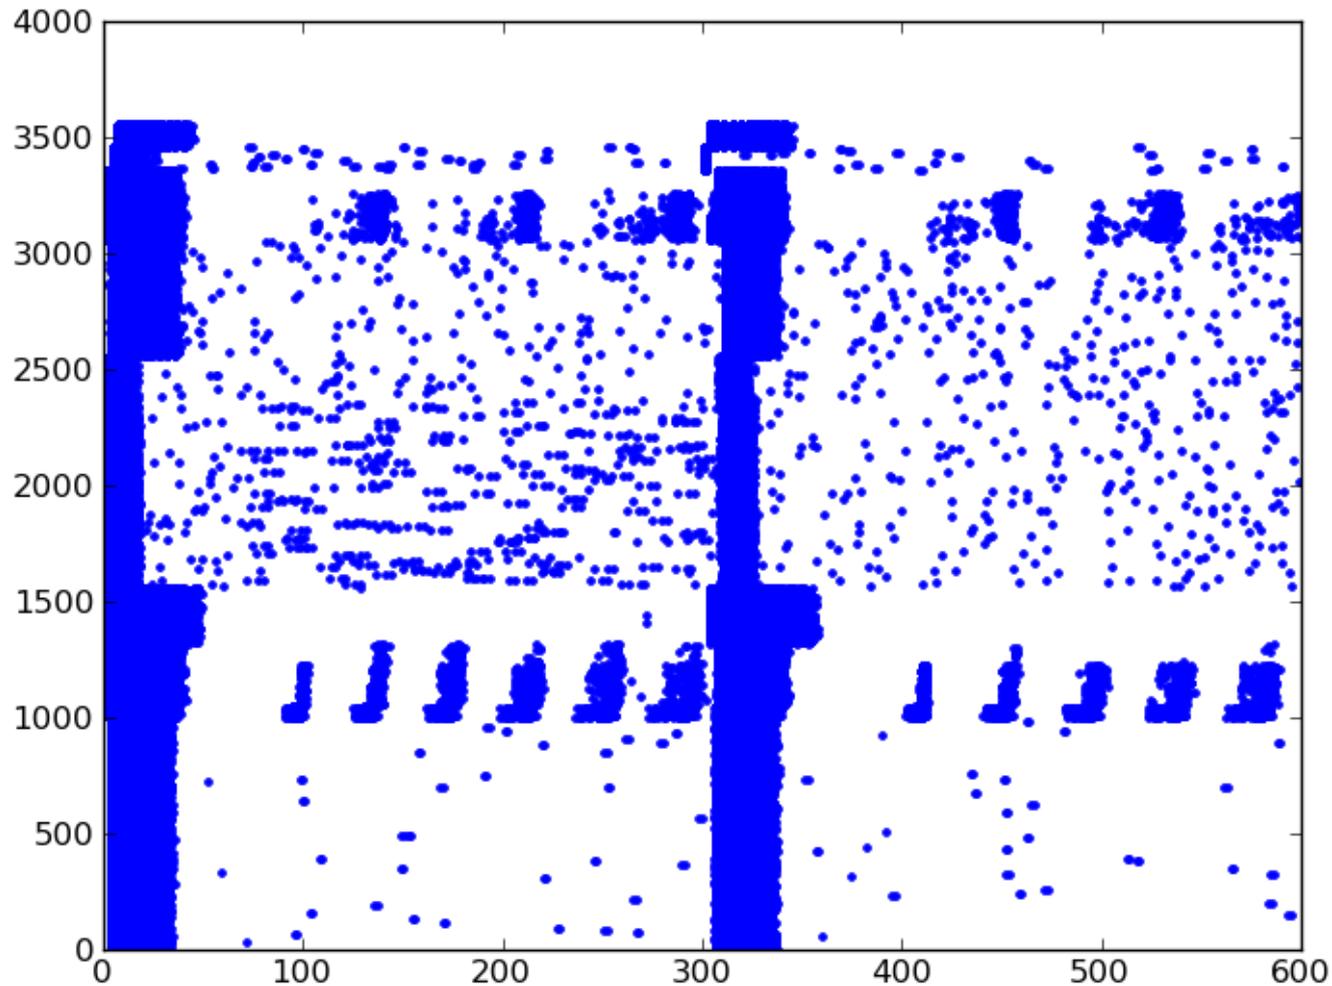

- Behavior (e.g M. Oberländer thesis)

Marcel Oberländer

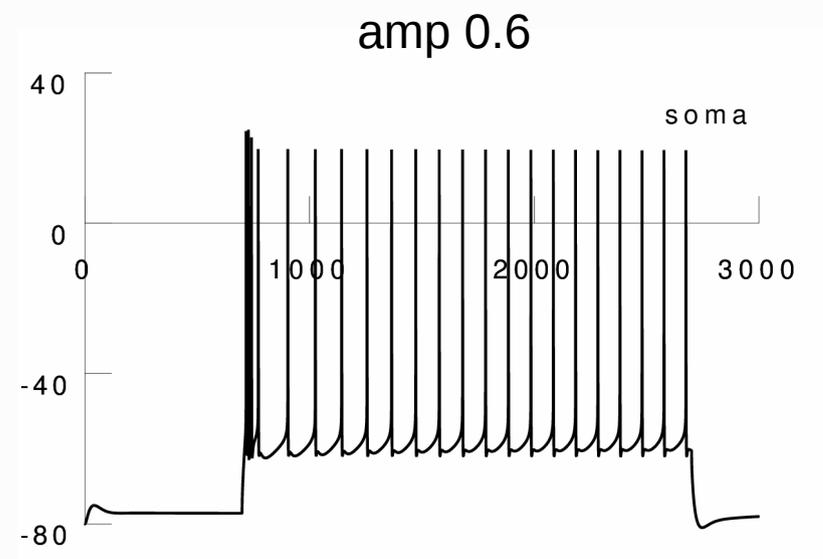

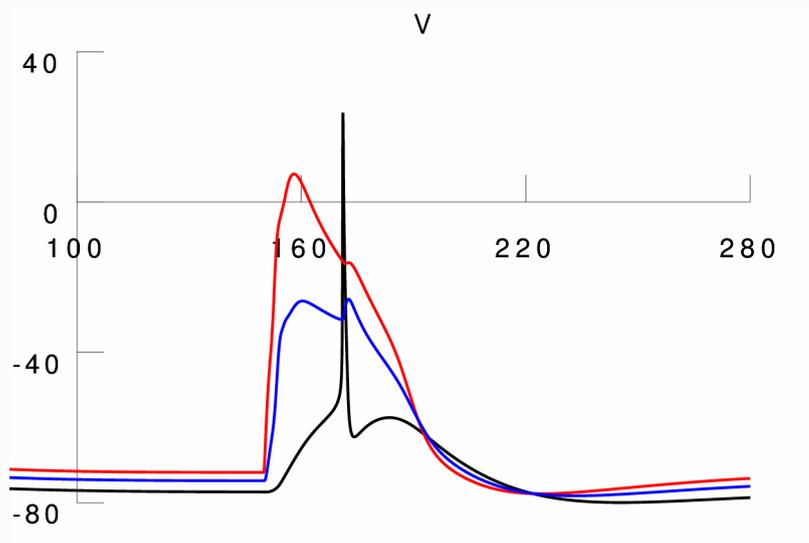

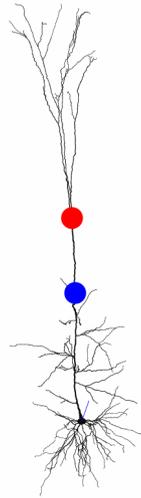

Thalamic input, Neuron, GABA *

0.06, awake = 0.5

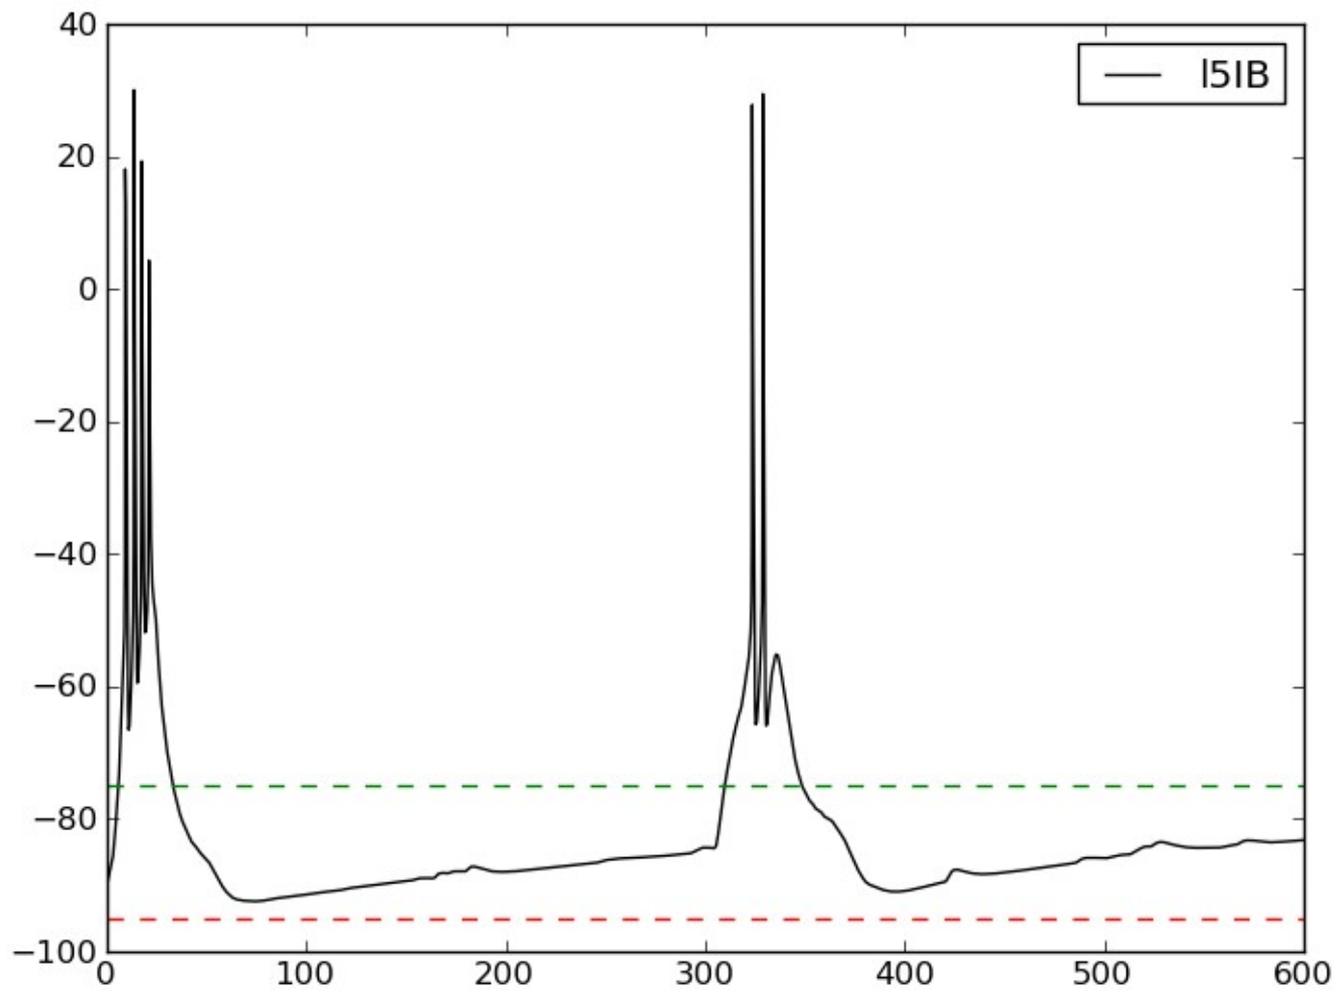

Hay model

Replacing Traub tuftIB by Hay cell

- In original Neuron version every section should be named as comp[i] (it is required in definition of synaptic connections)
- https://github.com/hglabska/Thalamocortical/tree/Neuron_
- Committed on 04 Jul

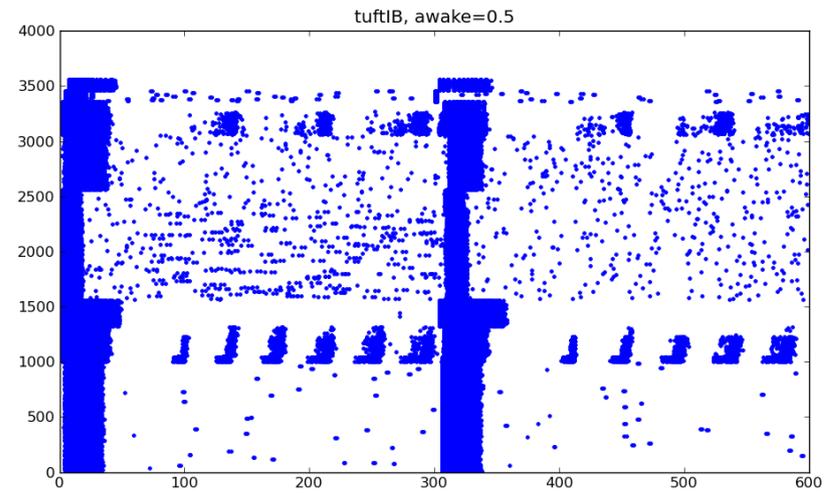

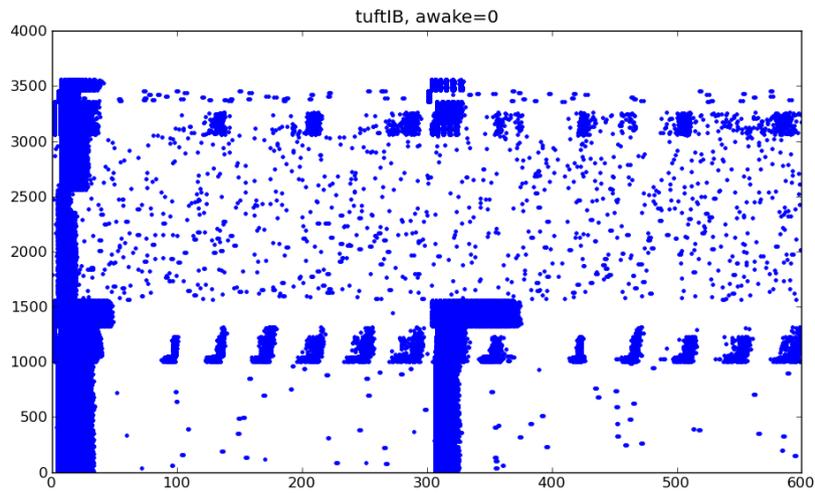

- Problems:
- What value should have e_gaba?
- Difficulties to get ectopic spikes

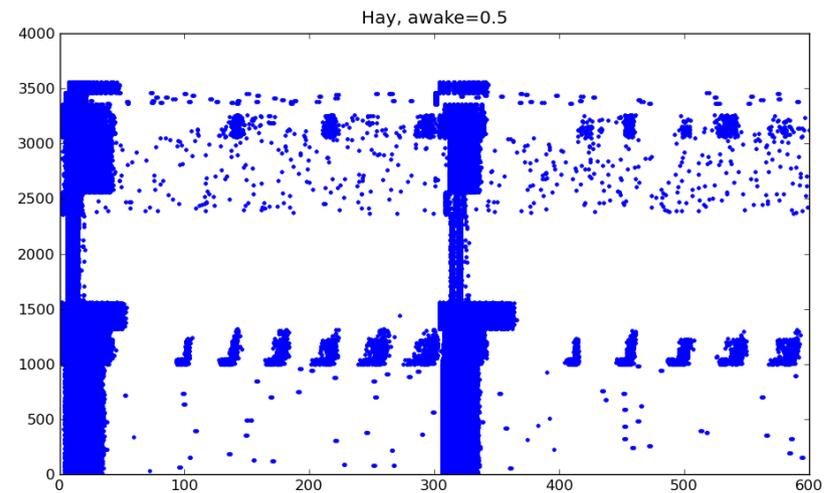

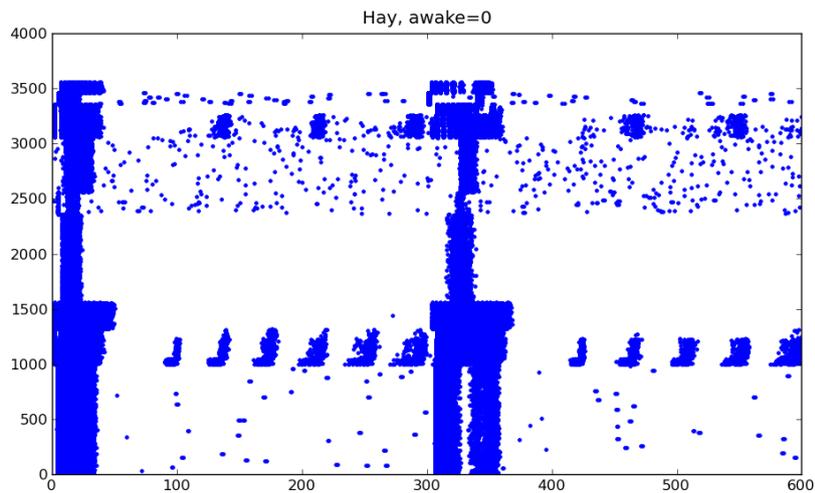

awake = 0

awake = 0.5

tuftIB

Hay

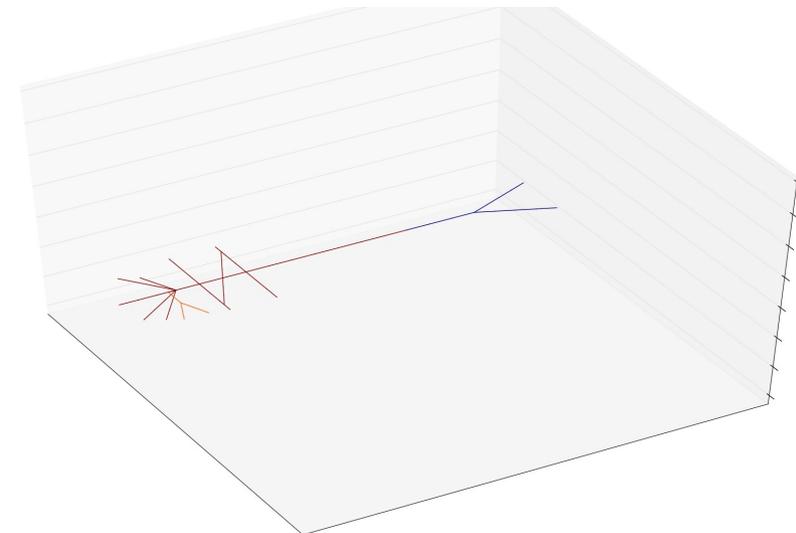

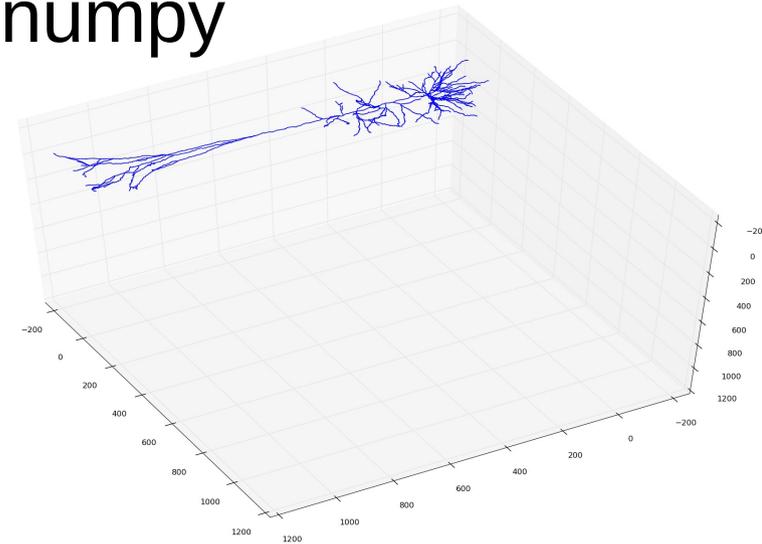

Testing models (Traub tuft IB and Hays Pyr cell*)

Requirements: PyNeuron , matplotlib, numpy

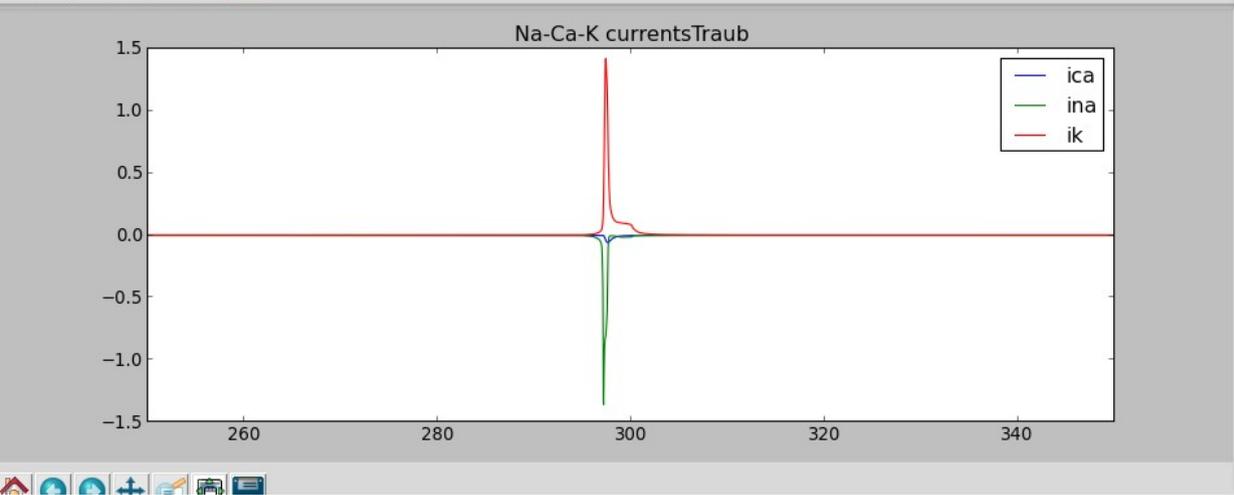

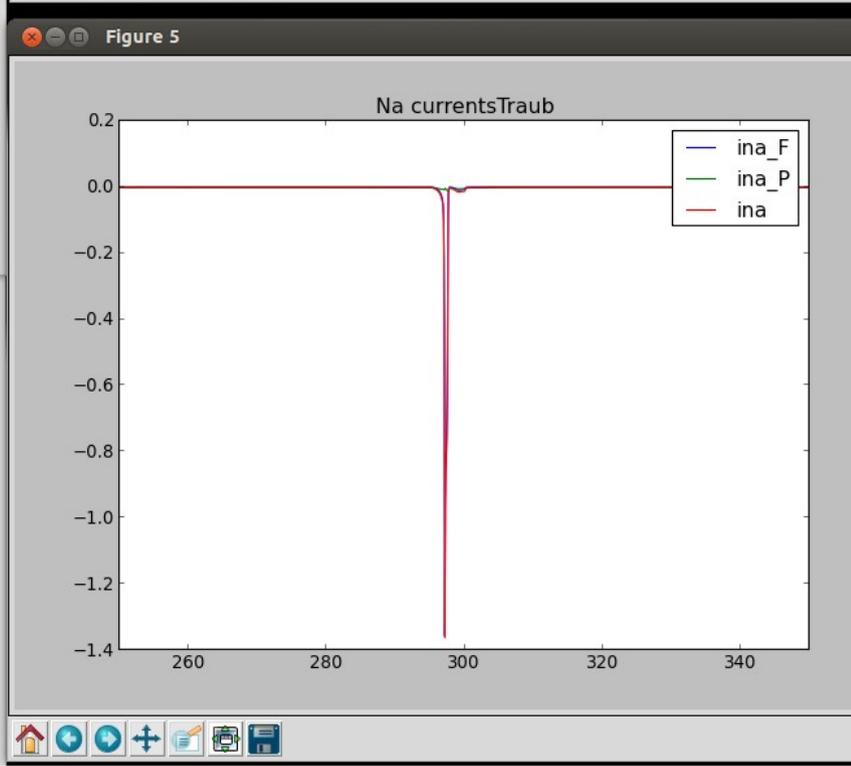

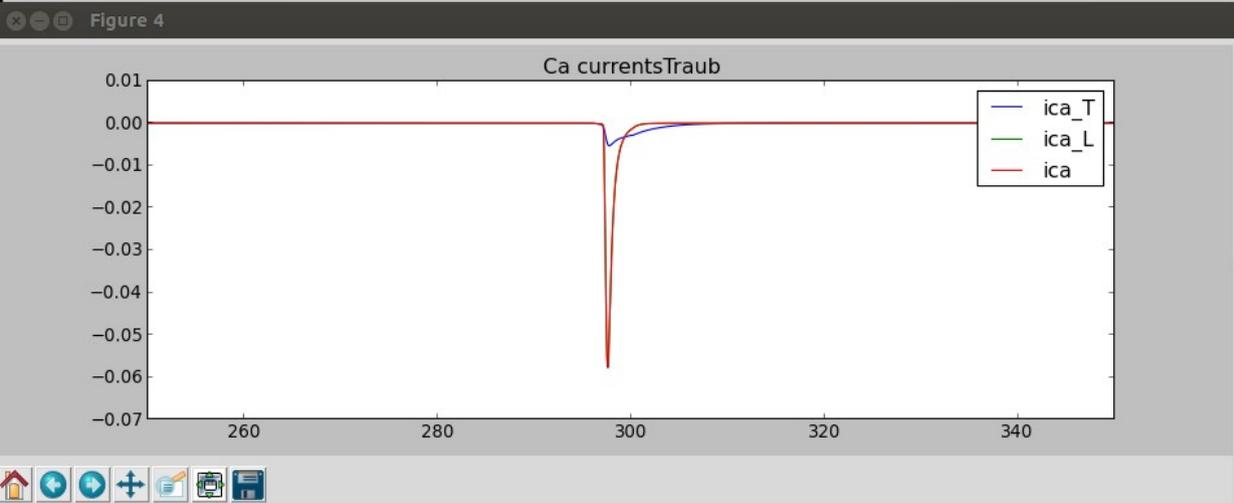

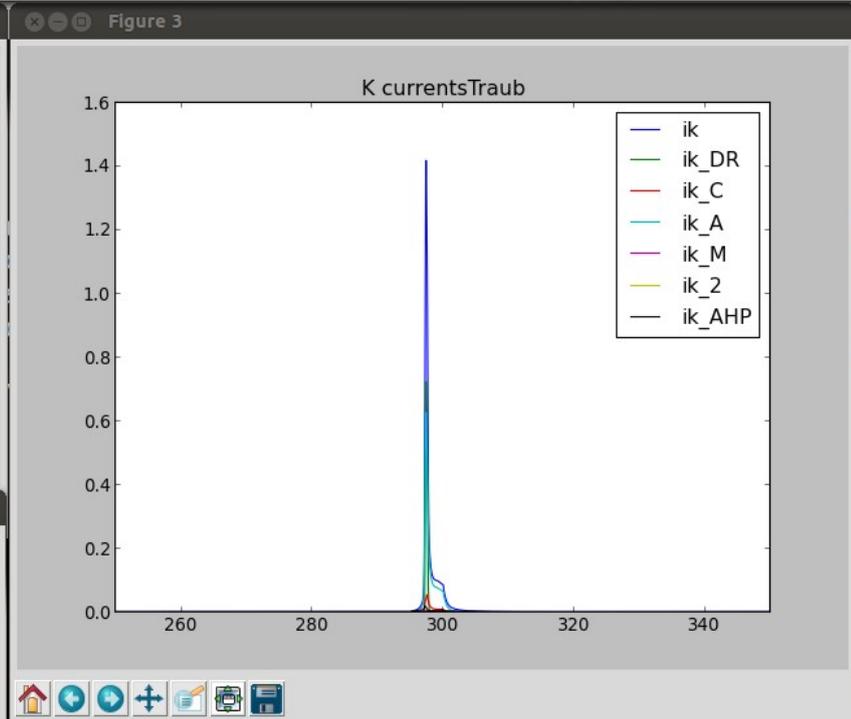

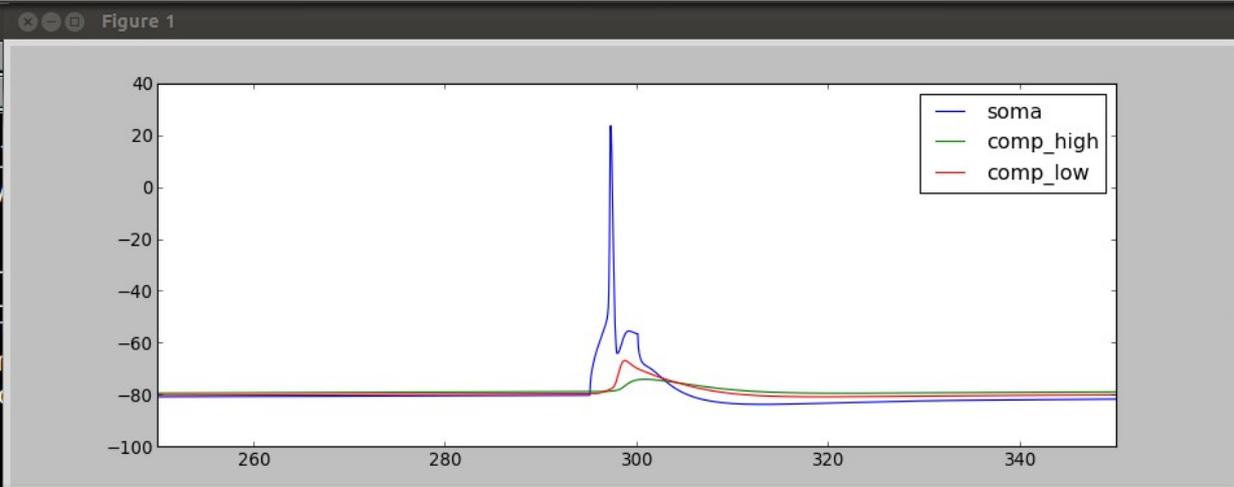

Morphology
Surface area
Cell length

Passive membrane properties
Channel densities
Currents (Na-K-Ca)

Scripts (github.com/ccluri/L5Pyr)

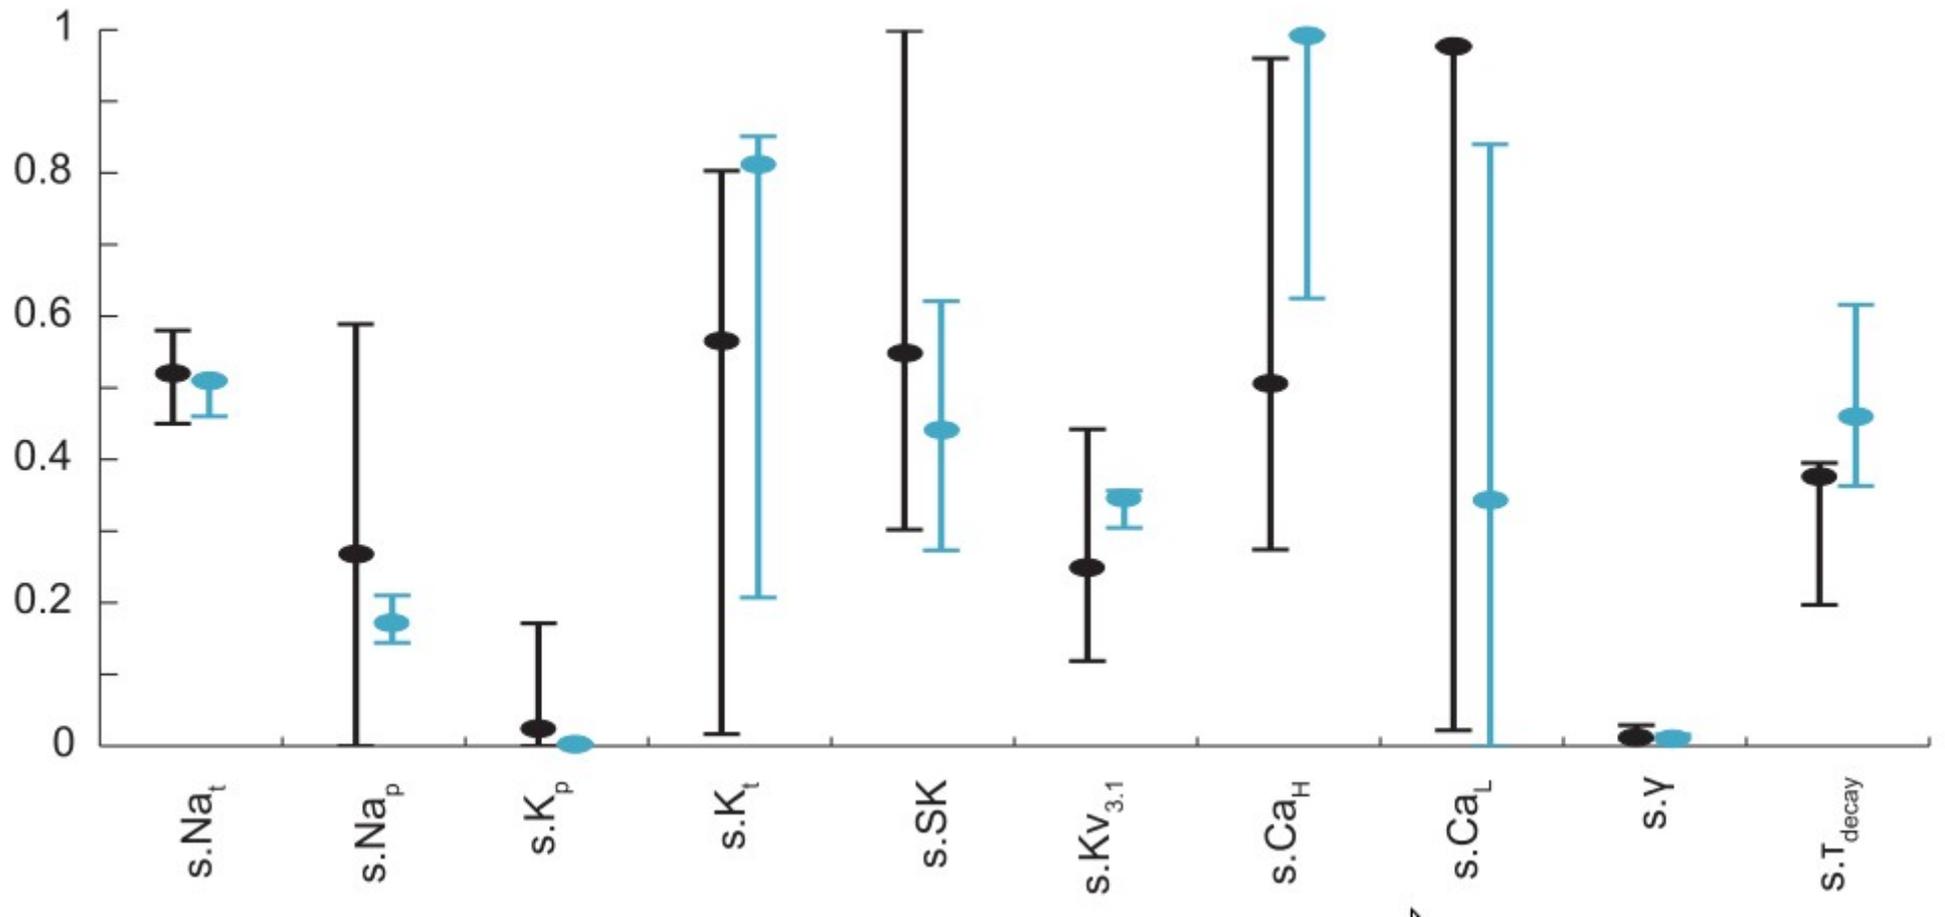

* idea is to extend to other models

Frequently used models

	Rm KOhm-cm ²	Cm uF/cm ²	Surface Area um ²
Mainen (1996)	30	0.75 - 0.04	52996
Traub (2005)	50	0.9	4132
Kole (2008)	15	0.9 - 0.02	
Larkum (2009)	20	1.0	44500
Hay (2011)	34-5(?)	1.0-2.0	17340

Hays Model

Distribution of the normalized parameter values in models targeted at only the perisomatic step current firing (black, $n = 52$), and in models that also fit the BAC firing target (blue, $n = 4$). The black and blue circles refer to the parameter values of specific models shown in Figure 2 and this figure, respectively. Ranges of some parameters in both cases overlapped, whereas the range of the Ca^{2+} τ_{decay} was markedly different in the two optimizations. Real values for the different ion conductances can be derived by referring to the upper limits given in Table 2.

doi:10.1371/journal.pcbi.1002107.g004

Some insights

Incomplete descriptions

Inconsistencies between published paper and model

Variability across models of the same cell

Naming conventions

Channel distribution over cells – generic rules?

Towards plug and play neuron models

- 1) Consistent naming convention for compartments / cells.
- 2) Channel naming conventions. (Channelpedia?)
- 3) Meta data. (Temperature, animal, preparation etc)
- 4) Automated tests and benchmarks that include variability.
- 5) Consensus on good model of a L5BPy neuron

Cheers!
